Chief, Photo Intelligence Division, RR

Comments on Beneficial Suggestion No. 58-278

The author has shown a great deal of insight in the application of stereo-microscopic viewing to photographic intelligence. Though none of the suggested techniques are necessarily new to the state of the art there was no stereo microscope adapted for photographic stereo viewing on the market at the time of the suggestion. This analyst has shown a great deal of ingenuity in adapting a presently available instrument for this type of work. This effort is commendable because it has made possible the use of this instrument approximately 18 months in advance of a commercially produced product. Due to the fact that the need for this type of instrument was very pressing it seems that this man should be rewarded. Although the suggestion is not in the same category as a technical break-through, it is recommended that a nominal monetary award be given in this case.
